

If you are responsible for Information Technology in your firm and you need to find easier ways to help your organization keep pace with technology, then you are probably considering cloud based technology solutions.

SVA has researched and brought on several cloud based technologies. These technologies are important because they help us focus less on the physical IT assets, and more on the ways in which technology can create a positive impact on our client's organizations. The goal is to make it easier to gain an advantage from technology, so that you can focus on what's important for your organization.

For those invested in the cloud today, the impact that cloud technologies is having for clients is dramatic. This impact can be best seen in the reduction of risk our clients have associated with things like compliance and data security and of course in financial savings in deploying new applications. We are just beginning to see these technologies impact organizations, but the early results indicate that this impact will be deep and lasting.

To see if you should be considering Cloud technologies ask yourself the following 3 questions.

1. Do I want to move the technologies forward for my organization but I struggle with the capital expenditures required to do so?
2. Have you seen an escalation in operation cost associated with managing technology infrastructure, through the procurement of hardware and/or services?
3. Has your cost of personnel dedicated to managing your IT environment gone up year over year and are more FTE's planned?

If you answered yes to these questions, then the cloud will likely provide you some choices for your organization.
